

**ABSTRACT**  
**TAX MANAGEMENT APPLICATION**

**Full Stack Development**

The Tax Management System is an application used by the client who is having a group of companies which provide various services like transport, food, accommodation, hospitals, institutes, and so on. The client had offered a benefit to their employees as, if an employee uses the services provided by their own group of companies, a claim of the tax amount will be provided as reimbursement to the employee. The accounts administrator needs to manually calculate the tax claim amount from each employee based on the expense type and expense amount. To automate this calculation process, develop a spring boot, Spring MVC application. This application needs to get employee id, expense amount and expense type as input. Based on the business rules given below, the claim amount should be calculated and displayed. The application will be used by the account's admin of the company.
