

## ABSTRACT

It is really a innovative idea, by using this equipment we are capable of taking the submersible pump out of the bore well. Since the water level is decreasing day by day more peoples are affected. Bore wells are needed to be drilled further to overcome water scarcity. While drilling further existing pipe & pump will break hence it has to be drilled 10 feet away from the old bore well.

Bore well recovery equipment is used to recover the pipe or submersible motor stucked underground. If we are not able to remove the broken pipes or submersible pump, Old bore wells are left opened after finding that ground water is not abundant in that place or finding that bore is useless with broken pipe & pump.

The main objective of this equipment is to recover the broken pipes or pump present underground.
