

## ABSTRACT

Hospital management system and weather prediction is a web-based application that was introduced to solve the complications coming from managing all the paper works of every patient associated with the various departments of hospitalization with confidentiality. This system provides the ability to manage all the paper work in one place, reducing the work of staff in arranging and analyzing the paper work of the patients. This will maintain the medical records of the patient and contact details safely and will keep track of the appointment dates. There are two sides in this system. Admin side and client side. Here, admin can add new doctors, view, and delete it. And adding new hospitals is also possible so that it will be useful for the clients to get an appointment to the hospital that they want. Whenever patients register for an appointment in client side it will be notified in admin side. Then admin can approve the appointment or can delete it. So, the respective response message will be shown to the client. For the ease of the client, they can also view the location of the hospital they are searching for. In Tele Health Technology health an evolution of telemedicine. This system will be helpful for the users to make an appointment and to consult doctors.
