

ABSTRACT

As we already know, in the modern world, technology has developed in leaps and bounds. But, there are places where the technology in the modern world hasn't reached. Particularly, in the field of agriculture, the modern technology has not made quite an impact. Our project focuses on developing the lives of the farmers by reduction of the time consumed by them. The drying of grains after harvest is a major problem faced by every agriculturist. It requires the farmers to spread the grains on a cement slab and spreading them out and walking through them every hour or so to jostle them and dry them quickly. Our project involves using a hand driven machine which can do that function instead of the farmers themselves walking through the cement slab for jostling the grains. This machine helps in reducing the time spent to dry the grains as well as simplify the life of the farmers.
