

ABSTRACT

The plight of undertrial prisoners often involves a lack of access to legal aid, healthcare services, and rehabilitation programs, leading prolonged detention and societal marginalization. To address these challenges, this project proposes the development of a web application specifically for undertrial prisoners. The Web app aims to provide a solution by offering access to legal resources, connecting users with pro-bono lawyers and healthcare providers, and facilitating rehabilitation through educational and vocational training opportunities, as well as mental health support. By leveraging technology to bridge these critical gaps, the proposed web app seeks to empower undertrial prisoners, enhance their access to justice, and facilitate their successful reintegration into society. The web application will function as a central hub for relevant resources, providing undertrial prisoners with a directory of legal aid organizations, healthcare providers, rehabilitation programs, and government agencies offering support services. This innovative solution has the potential to transform the lives of undertrial prisoners, fostering a more just and humane legal system. Future considerations include integrating the platform with existing legal and prison management systems, as well as developing a web application to ensure accessibility for all users. By fostering collaboration between legal professionals, social workers, healthcare providers, and government agencies, this project has to create positive impact on lives of undertrial pris
